Jannis Becke, Christian Lausberger and Maik Riestock

Advanced Topics in Machine Learning

June 22, 2015

# Data Preparation

49 Attributes, 101.000 Instances

Reasons for attribute removal:

1. **Uniqueness**
2. **Missing Values**
3. **Unequal Distribution**
4. **Single Attribute**

No instance was removed

# Choice of Algorithms

Algorithms:

- Naive Bayes
- SVM
- YATSI
- Decision Table

# Implementation

Choice of libraries:

- weka
- libSVM
- collectiveClassifiers

# Settings

Decision Table:

- Search: Best First
- Evaluation Measure: accuracy/RMSE

SVM:

- Type: C-SVM
- Kernel: radial basis function
- with normalizing, no weights

YATSI:

- KNNpe: 15

# Experiments

## Settings:

- Percentage Split / Cross-Validation
- Accuracy of classification as quality measure
- two additional data sets:
  - even class dataset (equally distributed classification attribute)
  - two class dataset (join label  $> 30$ ,  $< 30$ )

# Results

# Results

**Thanks for Your attention!**
